Here is the revision. I updated the risk paragraph. Pulled out here for quick review. Most of the contaminants are polycyclic aromatic hydrocarbons. Some people who have breathed or touched mixtures of PAHs and other chemicals for long periods of time have developed cancer. Some PAHs have caused cancer in laboratory animals when they breathed air containing them (lung cancer), ingested them in food (stomach cancer), or had them applied to their skin (skin cancer). Benzo(a)pyrene is a polycyclic aromatic hydrocarbon (PAH), and EPA determined it is carcinogenic to humans based on strong and consistent evidence in animals and humans.

I shortened both. Would like a PPT for Wilcox that puts in maps and figures.
